These results suggest that the use of a single, standardized, and validated instrument to assess the prevalence of depression in the community is feasible. The use of a single instrument may be particularly useful in studies where the prevalence of depression is low, as it may increase the power of the study. The use of a single instrument may also be useful in studies where the prevalence of depression is high, as it may reduce the risk of overestimation. The use of a single instrument may also be useful in studies where the prevalence of depression is unknown, as it may provide a more accurate estimate of the prevalence of depression in the community.
